

Project 3: Random Password Generator

Objective

The objective of this project is to generate secure random passwords using Python.

Tools Used

- Python
- Visual Studio Code

Description

The program asks the user for the desired password length and generates a random password using letters, numbers, and special characters.

Algorithm

1. Import the random and string modules.
2. Ask the user for password length.
3. Create a set of letters, numbers, and special characters.
4. Generate random characters.
5. Combine the characters to form a password.
6. Display the generated password.

Result

The program successfully generates random passwords of the specified length.

Conclusion

This project helped in understanding Python modules, string manipulation, and random data generation.
